1. Upon reconsideration, the indication of allowable subject matter concerning claims 13 and 19 has been rescinded and an action hereby follows on all the claims.

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 2-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over either of Suzuki et al in view of Mikami et al and the article to Hirose et al entitled "Optical Solder Effects of Self-Written Waveguides in Optical Circuit Devices Coupling" or Mikami et al in view of Suzuki et al and the article to Hirose et al.

Mikami et al and Suzuki et al are essentially applied for reasons of record, the references failing to teach using a splitter such that writing light (ie, the UV) is sent through a first path to expose the waveguide and a signal light source (ie, the 850 nm to PD) is sent through a second path to be monitored and allow an evaluation of the signal light. Hence, it is respectfully submitted that the article to Hirose et al teaches whatever was found to be lacking in Mikami et al and Suzuki et al concerning the use of a splitter as one of the optical elements.

3. Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

While applicant's amendment presents claims in independent form which had been indicated as allowable, upon reconsideration and careful review of the article to Hirose

et al, it is now believed that these claims would not be patentable. Clearly, Hirose et al envisions using a splitter/recombiner device to polymerize paths in "self-written" waveguides and evaluate the performance of the signal light.
